DETAILED ACTION

Response to Arguments

1. Applicant's arguments, see Applicant's remark, filed on 06/16/2006, with respect to the rejection(s) of claim(s) 1-20 under 102(b) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of Wycherley et al. (U.S. Pub. No.: 2002/0037738).

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Application/Control Number: 10/604,289

Art Unit: 2618

3. Claims 1, 4-7, 9-10, 11, 15-17, and 19-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Christian Lindholm UK Patent Application (GB 2355126, hereinafter, "Lindholm") in view of Wycherley et al. (U.S. Pub. No.: 2002/0037738, hereinafter, "Wycherley").

Regarding claims 1 and 11, Lindholm teaches a method and a cellular phone comprising (see figure 1):

a housing (see figures 3&4, front cover 21, 22);

providing an ID module on the cover for identifying the cover (see figure 10, identification unit 20);

a cover detachably installed on the housing, the cover containing an ID module for identifying the cover (see figures 2, 3, 4, 10, the cover 21 is included a ID unit 20 for installing on body of mobile phone 1, page 8);

a transceiver (read on transmitter/receiver circuit 19 and processor 18) for controlling operation of the cellular phone, the transceiver containing a detection port for communicating with the ID module of the cover and determining identification of the cover (see figures 2&10, processor 18, ID unit 20, ports 23&25, page 8);

a memory electrically connected to the transceiver (see figures 2&11, memory 33, pages 11-12).

It should be noticed that Lindholm fails to teach storing a database in memory, the database containing multiple sets of operation parameters corresponding to different covers of the cellular phone, searching the database to locate the set of operation parameters corresponding to the identified cover, and operating the cellular phone with

Application/Control Number: 10/604,289

Art Unit: 2618

the located set of operation parameters. However, Wycherley teaches storing a database in memory (see figure 2, the mobile phone 2 should have a memory for storing the data such as pre-stored catalogue), the database containing multiple sets of operation parameters corresponding to different covers of the cellular phone (the memory is pre-stored catalogue of internal configuration corresponding to different covers, [0040, 0043]), searching the database to locate the set of operation parameters corresponding to the identified cover, and operating the cellular phone with the located set of operation parameters (it is obvious that when the cover is attached to the phone, it is automatically searching in the memory with pre-stored catalogue of internal configuration corresponding to different covers, [0040, 0043].

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teaching of Wycherley into view of Lindholm in order to replace the new cover without buying a new phone.

Regarding claims 4 and 15, Wycherley further teaches the memory to store parameter providing user interface attributes to the transceiver according to the identification of the cover (the memory is pre-stored catalogue of internal configuration corresponding to different covers such as sound or graphics, [0040, 0043]).

Regarding claims 5 and 16, Lindholm further teaches database contains a keypad-mapping configuration corresponding to each cover (see figures 5&6, page 8).

Regarding claims 6 and 17, Wycherley further teaches a set of sound filed corresponding to each cover (see col.1, [0009]).

Regarding claim 7, Wycherley further teaches graphical images corresponding to each cover (see col.1, [0009]).

Regarding claims 9 and 19, Wycherley further teaches the ID module of the cover contains a unique resistance value for identifying the cover, and the transceiver measures the resistance for determining the identification of the cover (see col.5, claim 8).

Regarding claims 10 and 20, Lindholm further teaches the detection port of the transceiver is capable of communicating with the ID module of the cover in parallel for determining the identification of the cover (see figure 10, the connector 25 of cover with ID unit 20 is parallel with connector 23 of the body of the mobile phone).

4. Claims 2 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Christian Lindholm UK Patent Application (GB 2355126, hereinafter, "Lindholm") in view of Wycherley et al. (U.S. Pub. No.: 2002/0037738, hereinafter, "Wycherley") as applied to claims 1 and 11 above, and further in view of Nordwall (U.S. Patent No.: 6,097,943).

Regarding claims 2 and 13, Lindholm and Wycherley, in combination, fails to teach providing Finite Impulse Response (FIR) filter coefficients to the transceiver for improving acoustics of the cellular phone. However, Nordwall teaches such features (see figure 4, memory 63, col.5-6, In.49-67, 1-27).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teaching of Nordwall into view of Lindholm and Wycherley in order to reduce the echo in the mobile phone.

5. Claims 8 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Christian Lindholm UK Patent Application (GB 2355126, hereinafter, "Lindholm") in view of Wycherley et al. (U.S. Pub. No.: 2002/0037738, hereinafter, "Wycherley") as applied to claims 1 and 11 above, and further in view of Nielsen (U.S. Pub. No.: 2005/0090280).

Regarding claims 8 and 18, Lindholm and Wycherley, in combination, fails to teach LED. However, in an analogous art, Nielsen teaches such features (see col.6, [0068]).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teaching of Nielsen into view of Lindholm and Wycherley in order to display the illumination effect to the user when the cover is partly transparent as suggested by Nielsen at column 5, [0068]).

Allowable Subject Matter

6. Claims 3 and 14 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Application/Control Number: 10/604,289

Art Unit: 2618

Conclusion

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Tuan A. Pham whose telephone number is (571) 272-8097. The examiner can normally be reached on Monday through Friday, 8:30 AM-5:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew Anderson can be reached on (571) 272-4177. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have question on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
